AGN properties explained by AGN unification

- Strong UV to X-ray continuum ⇒ blackbody from accretion disk
- rapid variability in blazars, no emission lines
- gamma ray emission commonly seen in blazars
- Strong broad emission lines
- Strong narrow emission lines
- Strong jet emission in radio
- Steep spectrum emission in radio lobes
- One sided jets in most quasars ⇒ Doppler boosting
- Jets aligned on all length scales probed
- AGN are more common at z ~ 2
- Superluminal motion
- zero proper motions

AGN Physical parameters

< ロ > < 同 > < 回 > < 回 >

AGN Physical parameters - another view

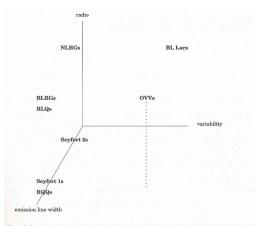

Fig. 1.9 The principal subvarieties of AGNs schematically arranged according to relative power in the radio band, emission line width, and variability. All combinations are possible except that there are no highly variable radio-quiet objects.

Krolik (1999

4/24

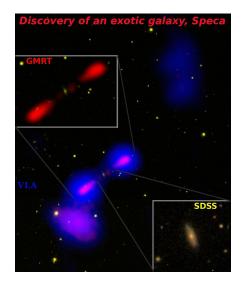

IUCAA-NCRA Grad School

Radio loud and Radio quiet likely depends on the spin parameter $a = \frac{cJ}{GM^2}$

Radio Loud	Radio Quiet
High Spin $a \sim 1$	Low Spin holes
Produce jets	No jets
Spectrum dominated by non-thermal	Both thermal and non-thermal

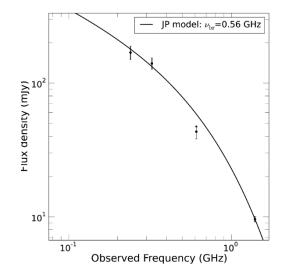

AGNs with large radio structures (kpc scale jets) are invariably hosted in elliptical galaxies. Why should this be the case?

NGC 3801 Speca

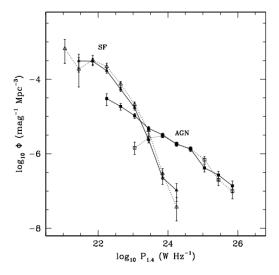

Hota et al. (2012) How do we find more SPECA like galaxies?

Radio spectrum of radio lobe

How could you use the lobe spectrum to find distant radio galaxies?

Luminosity function of AGN and SF galaxies

Can we detect AGN with photometric data alone?

크

Can we detect AGN with photometric data alone?

Efficient detection of AGN in individual galaxies using X-rays

Compton thick AGNs will still be missed by X-ray imaging

Efficient detection of AGN in deep fields

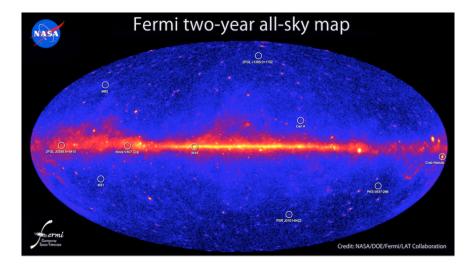

At high redshift, we cannot spatially resolve AGN light from host-galaxy starlight. X-rays enable efficient AGN selection.

4 A N

The Gamma ray sky

イロト イポト イヨト イヨ

What type of sources has Fermi found?

The high-energy gamma rays from AGN get absorbed in the atmosphere. Upon interaction with the atmosphere, these photons produce electron-positron pairs, leading to a cascade of particles which while moving at very high speed give rise to Cerenkov radiation.

Scintillation counter

IUCAA-NCRA Grad School 19/24

æ

- highest energy cosmic rays may be iron nuclei rather than protons
- very rare cause an enormous "air shower" which can be detected with the atmospheric Cerenkov experiments and on ground detectors
- most energetic particles are > 10²⁰ eV. equivalent to a cricket ball travelling at 150 kmph from a particle!

M87 Polarisation map with EHT

Magnetic fields strong enough to push back on the hot gas and help it resist gravity's pull; gas that slips through the field can spiral inwards

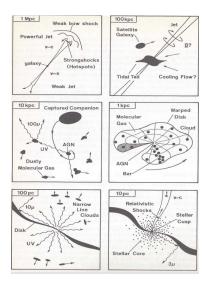

Beast	Pointlike	Broad-band	Broad Lines	Narrow Lines	Radio	Variable	Polarized
Radio-loud quasars	Yes	Yes	Yes	Yes	Yes	Some	Some
Radio-quiet quasars	Yes	Yes	Yes	Yes	Weak	Weak	Weak
Broad line radio galaxies	Yes	Yes	Yes	Yes	Yes	Weak	Weak
(FR2 only) Narrow line radio galaxies (FR1 and FR2)	No	No	No	Yes	Yes	No	No
OVV quasars	Yes	Yes	Yes	Yes	Yes	Yes	Yes
BL Lac objects	Yes	Yes	No	No	Yes	Yes	Yes
Sevferts type 1	Yes	Yes	Yes	Yes	Weak	Some	Weak
Sevferts type 2	No	Yes	No	Yes	Weak	No	Some
LINERs	No	No	No	Yes	No	No	No

Table 1.2: The AGN Bestiary

Krolik (1999)

AGN wind outflows - BAL Quasars - Obscured AGN (Submillimeter studies with ALMA) - high redshift AGN and implications to galaxy evolution - numerical simulations of jets and AGN - evolution of the SMBH mass function.

AGN Phenomena
